Module Convenor:Professor Thomas Birtch

Common Features

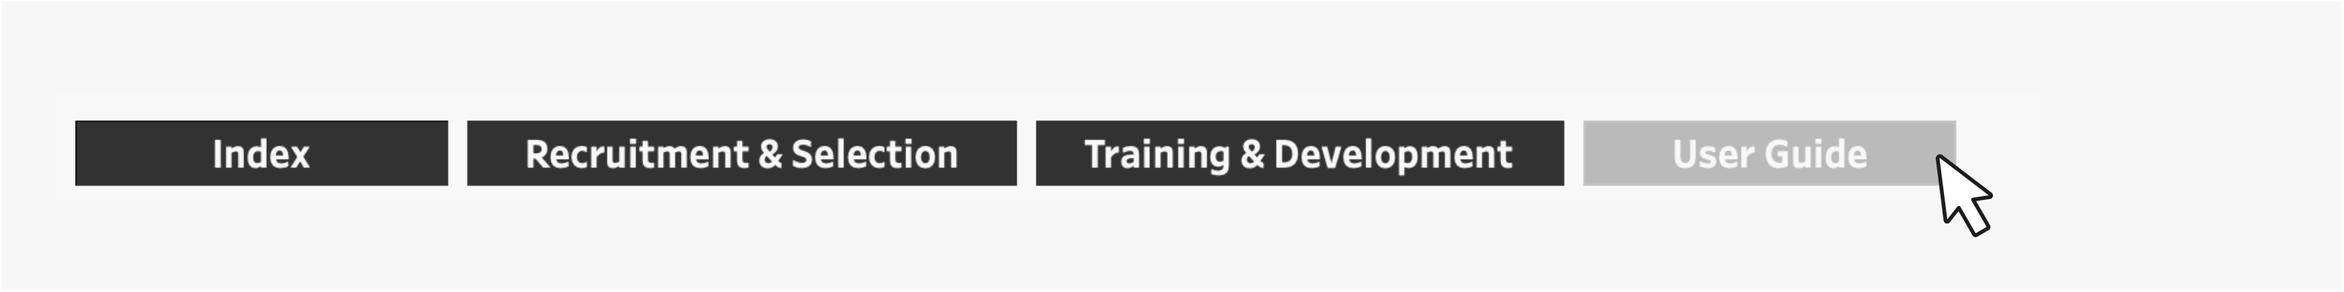

Key Scorecards

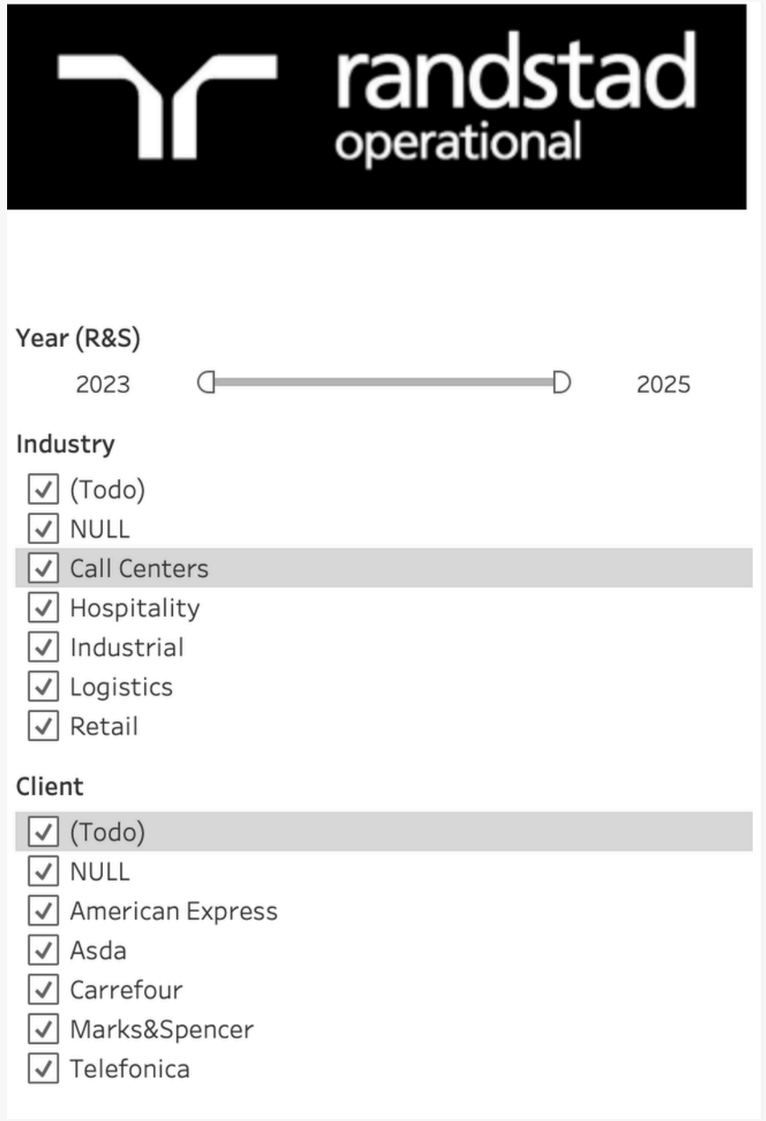

On every dashboard present in the Computerized Dashboard System a socrecards band is presented with the most relevant insights for that Hr Area or Business Performance Overview in order to help the user rapidly acces the ifnormation and its highlight to, later on, draw in depth insights from the graph's analysis,

Navigation Band

In order to easily navigate across the Computarized Dashboard System, a Navigation Band is displayed on every dashbaord and when clickin on its different buttons it will redirect the user to that page. If needed, the user guide can be consulted rapidly y clicking in it and the user shall be redirected to the current document.

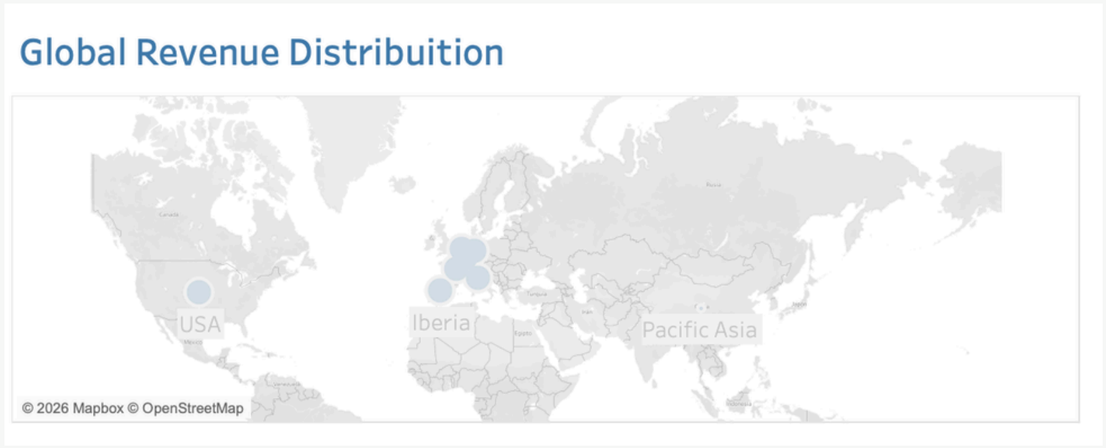

Filters

On every dashboard present in the Computerized Dashboard System a common filtering bar can be found. Every graph as long as data availability allows, can be modified following the specific selection criteria for the filtering making it easy for the user to analyze a specific HR Activity or Performance Management metric in comparison to key competitors and forecast its trend.

The filtering options allow the user to filter per Year, Industry and Client for in depth analysis.

Business Overview

Graphs Explanation - Strategic Management Value - Metrics Glosary - What If Analysis Methodology Applied

Global Revenue Distribuition

On the current graph it is possible to see the actual distribuition of Randtsad's Operational Business Unit Revenue across the globe.

The core functionality of this graph is to quickly identify in which countries or regions the company is stronger or weaker, according to interest when analyzing.

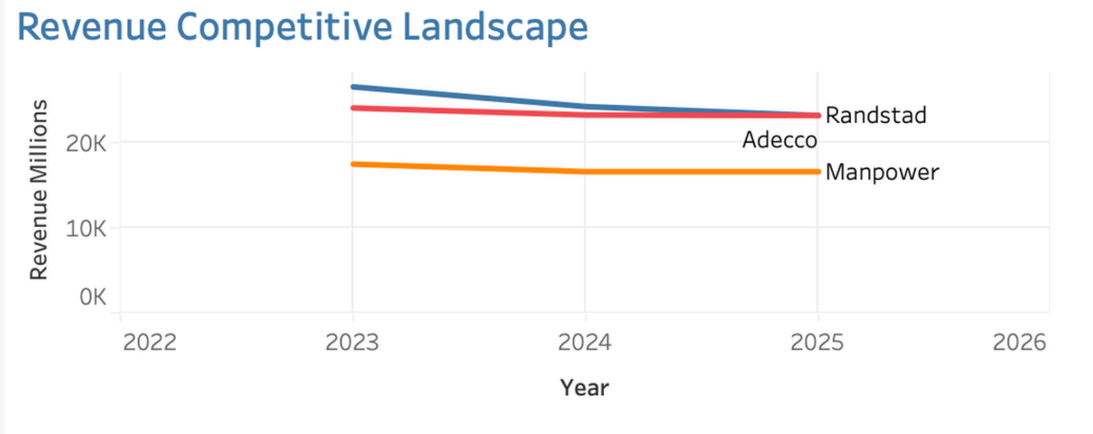

Leveraging on the filters, it is possible to also see how a specific industry is driving the revenue globally. Moreover, it is possible to filter by client seeing how is that particular client driving the company's revenue globally.

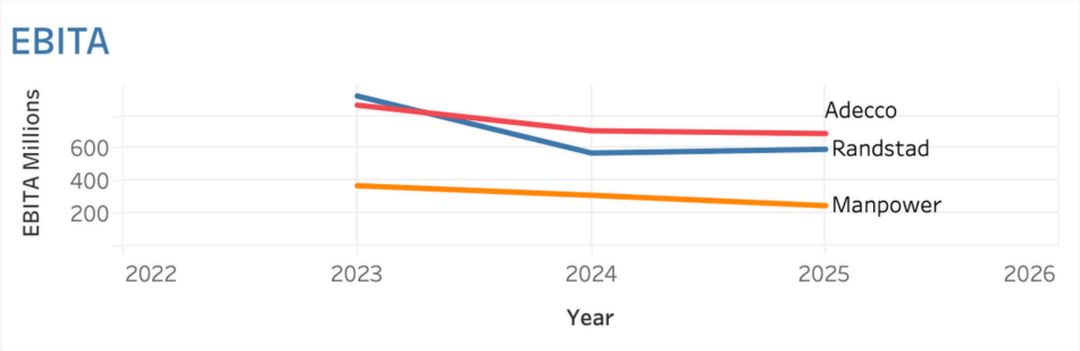

Revenue Competitive Landscape

On the current graph it is possible to see how Randstad's Operational Revenue is evolving in comparison to its major competitors - Manpower and Adecco globally.

However, leveraging on the use of filters, it is possible to filter per country if it were necessary to analyze the competitive landscape in a specific region or country.

The available data regards past years and it can be forecasted utilizing Tableau's forecasting tool.

EBITA

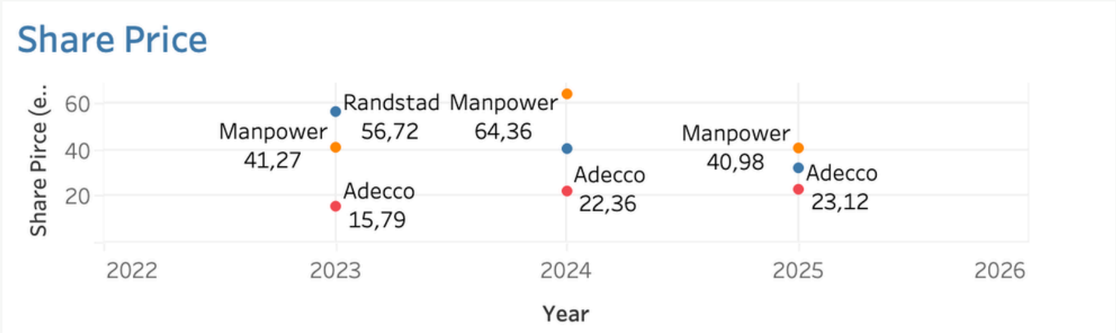

On the current graph, the evolution and forecasting of EBITA can be seen and analyzed in comparison to the competitors.

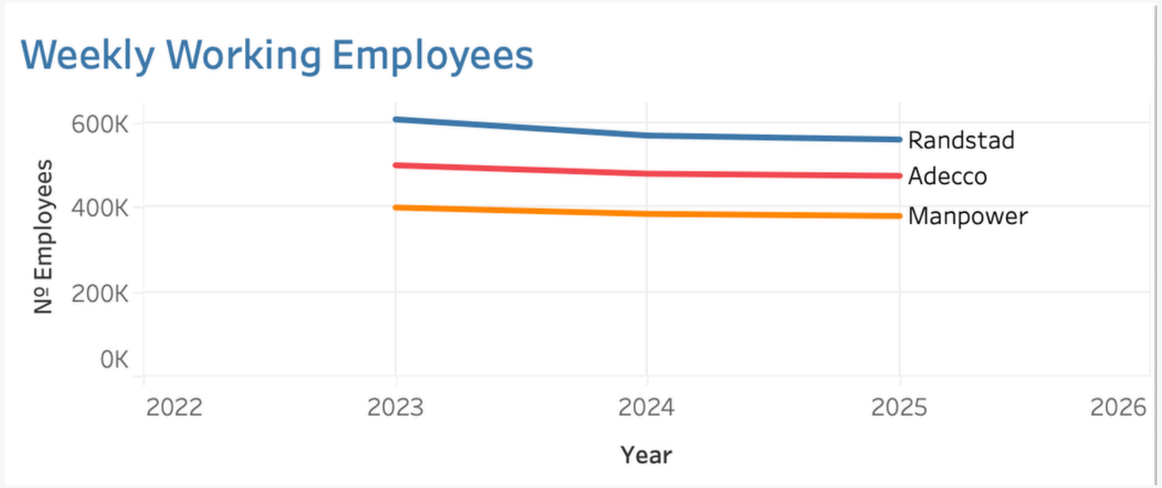

EBITA (excluding the depreciation) is the internal metric utilie by Randstad to meassure the company's financial health position. Therefore, EBITA is the key metric for performance management included on the current dashboard. (Randstad, 2025).

Leveraging on the filters, it is possible to filter per country in order to analyze the company's financial health in a specific regional market.

Share Price

On the current graph it is possible to see the evolution and forecasted share price of the company in comparison to its competitors.

Weekly Working Placed Employees

On the current graph it is possible to see the actual amount of temporary employees which are placed across Randstad's Clients. Since the amount of workers the company is able to place on clients's projects is a key metric to measure growth (Rndstad, 2025), this graph is quite essential .

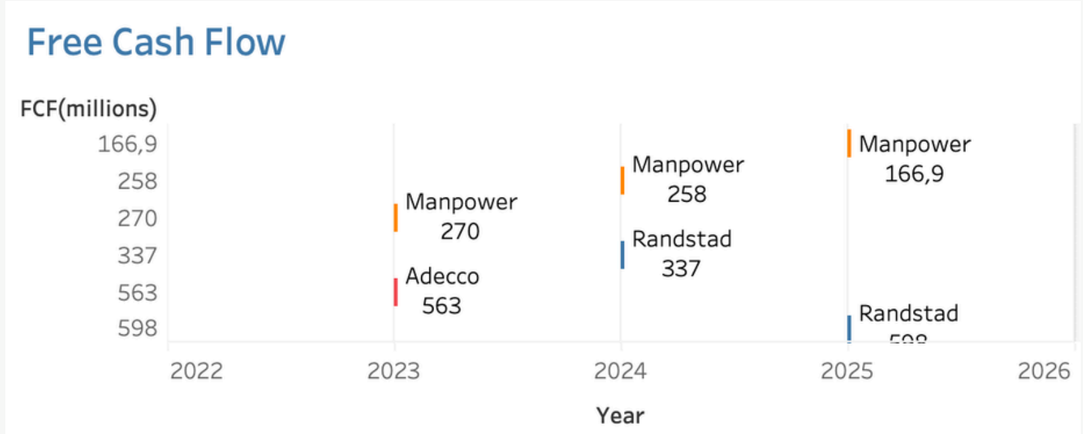

It is possible to use the filters in order to analyze the company's growth per client and in specific regions or countries.

Furthermore, it is possible to benchmark to competitors to compare the growth of the different companies which speaks of marketshare dominance.

Free Cashflow Quantity

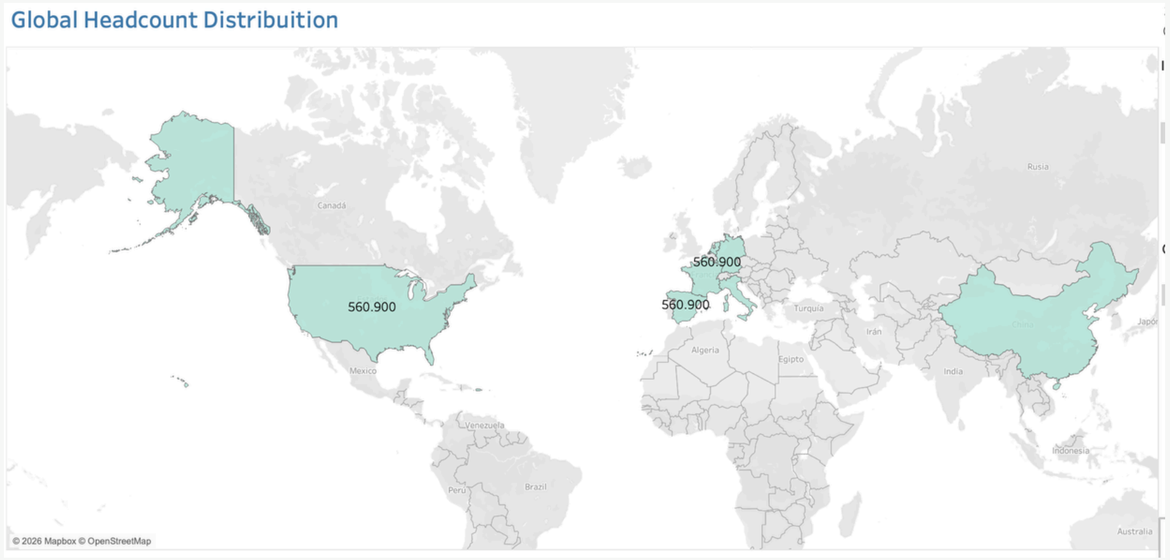

Cash flow does not only reflect a company's profitability, but also its capacity to invoice and collect payments from its clients. Furthermore, this metric can help managerial stakeholders understand the real amount of money available for further improvements and investments.

The graph below shows the company's Cash Flow — a key metric for performance management at Randstad (Randstad, 2025) — in millions, with its evolution compared against competitors.

Recruitment & Selection

Graphs Explanation - Strategic Management Value - Metrics Glosary - What If Analysis Methodology Applied

Global Headcount Distribution

On the current graph it is possible to see the current distribution of the global headcount for Randstad s' Operational Business Unit.

The strategic value of the graph is to identify in which countries or regions the demand for operational talent is wider and, therefore, driving the company's revenue.

Using the filters it is possible to identify how is the talents distribuited per client or per region.

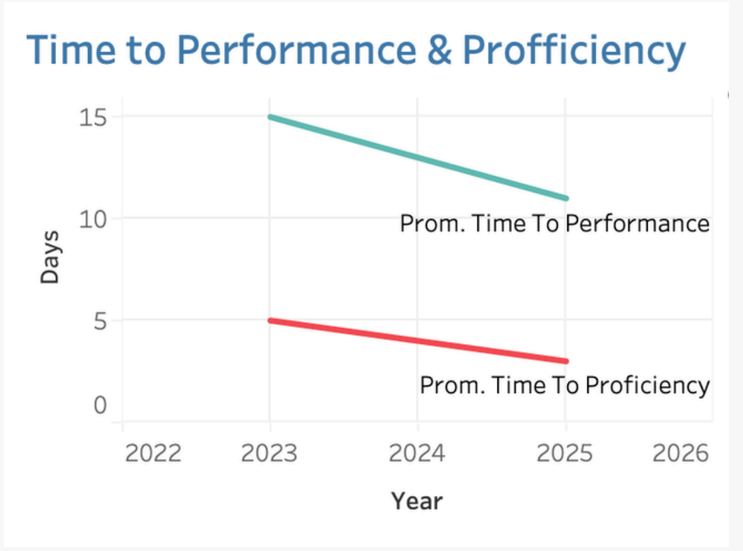

Time to Performance & Proficiency

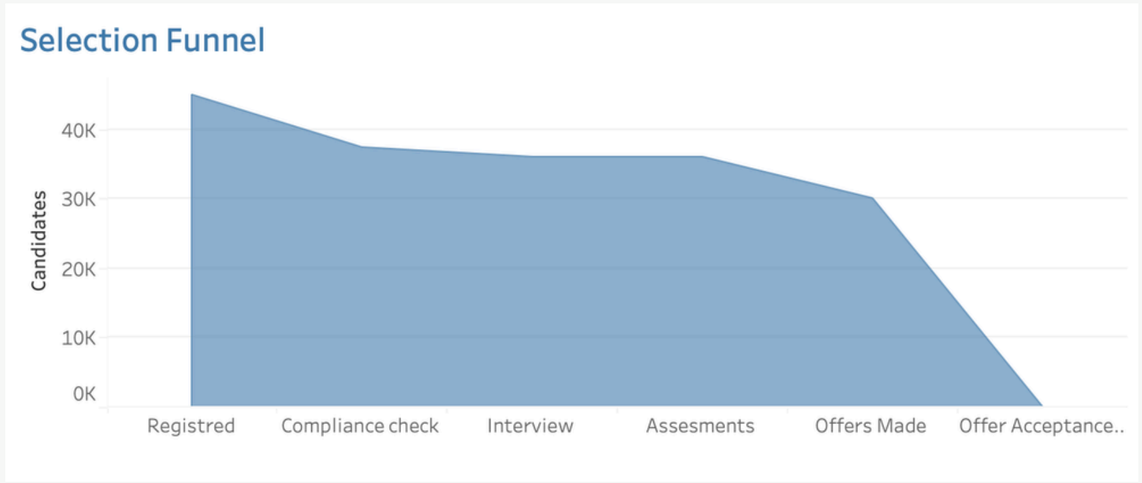

On the current graph it is possible to see the evolution and forecasted Time to Performance and Time to Profficiency of an employee after being hired for a particular position. If needed to analyze the different industries in which the company offers its services as well as the progress in certain project of a specific clients, it can be done utilizing the common filters.

Metrics Glossary:

Time to Performance: The time for a new employee to start performing at the minimum expected level of quality needed for that particular job position (Bauer, 2019).

Time to Proficiency: The time for an employee to excell in its position. (Bauer, 2019).

Selection Funnel

The graph above shows how the different phases of the selection process operate, along with the specific Yield Rate at each stage. This makes it possible to clearly see how many candidates register on the Randstad Talent Platform, how many of them end up being hired, and at which stage they drop off.

The strategic value of this graph lies in the fact that Randstad's talent recruitment strategy is leveraged on the acquisition funnel, improving the quality of the talent entered to make them more employable. It is therefore essential to identify where candidates are dropping off, in order to strengthen their chances of success to reduce Time to Hire and Cost per Hire due to replacement costs.

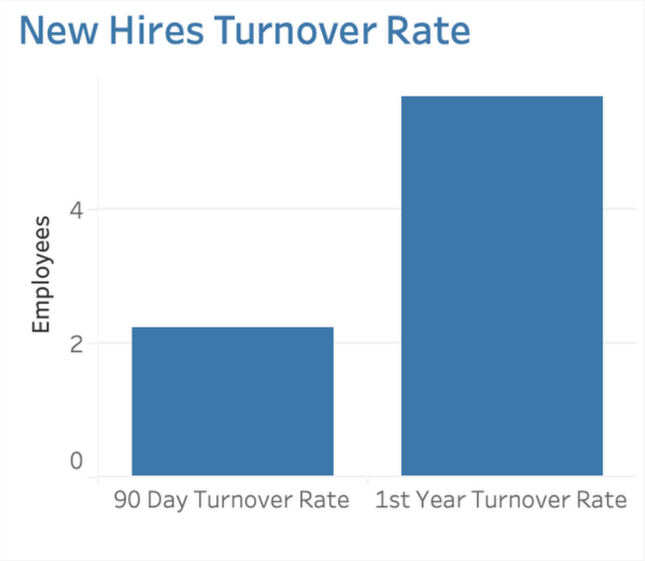

Two essential metrics regarding early turnover are also taken into account, and this graph is complementary to the one below: out of the candidates who registered, it shows how many were hired and how many remained after the period reserved for early leavers.

For in depth critical analysis, it can be filter by Country, Industry and Clients.

New Hires Turnover Rate

On the current graph it is possible to see the turnover rates for new hires.

It is possible to filter by Country, Industry and Client.

Cost Per Hire

On the current graph it is possible to see the evolution and forecast of the Cost Per Hire. If necessary, it is possible to filter per Country, Industry and Client since not every project requires the same talent and those differences could imply a variation in the selection step.

Metric Glossary

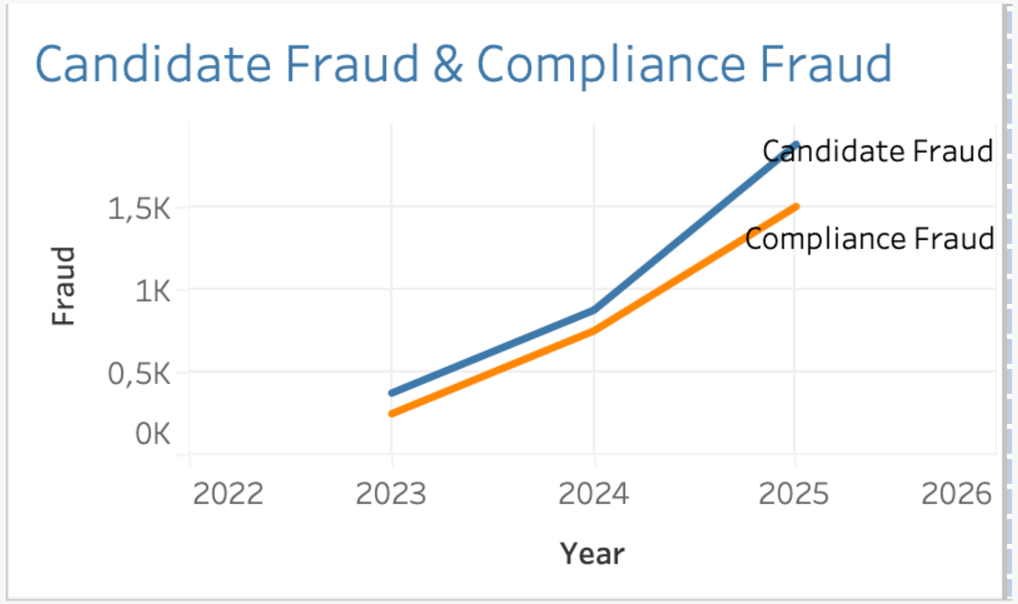

Cost Per Hire: The amount of capital invested in a single hire. In Randstad's operational business, it accounts not only for the regulatory paperwork, but also for the hourly rate paid to the recruiter who handles the selection process, the technological features incurred, and the courses offered during the selection process which boosted the candidate's chances.

Time to Hire

On the current graph it is possible to see the evolution and forecast the expected time to hire an employee for a particular position which could be filter by Country, Industry and Client.

The strategic value of the graph is to have operational prevision and to clarify with the client and the actual team how much time it is expected to take until a new person is incorporated to the team. In combination with the Time to Performance and Time to Profficiency graphs, it will be possible to also state in how much time that new employee will start to perform and, later on, excel .

Candidate Fraud & Compliance Fraud

On the current graph it is possible to see the evolution and trend of Candidate and Compliance Fraud. SIn ce the Industry demands total protection against candidate fraud, this is a metric which proves highly valuable to report to clients and to internally monitor the company's efforts on this regard.

Data Sources: It is suggested that, once a recruiter discards a candidate for one of these two reasons, this should be assessed and recorded for future consideration — in case that person applies for a job with a different recruiter later on, since these reasons speak to their integrity. That record could then feed the data for this graph.

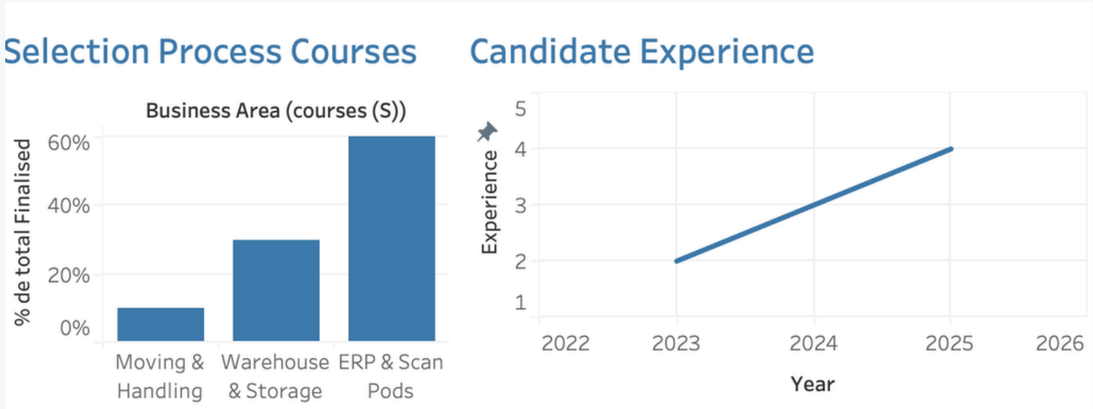

Selection Process Courses / Candidate Experience

On the current graph it is possible to see which are the offered courses for candidates in the selection process in order to boost their skills are completed. Furthermore, it is possible to see the evolution and trend on the candidate experience on the selection process and its implications.

Metric Glossary

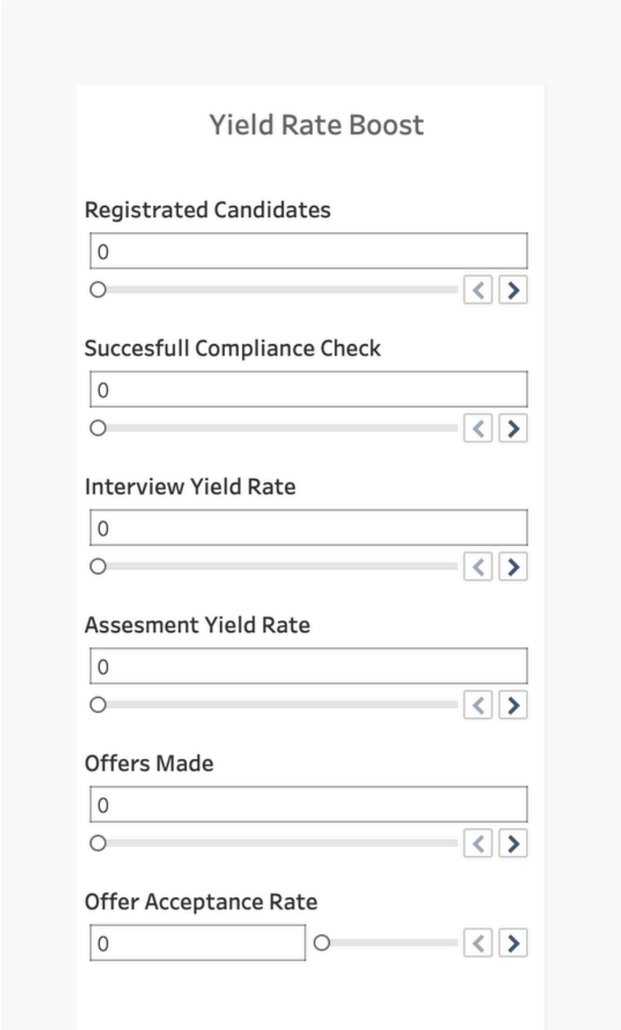

Candidate Net Promoter Score: The rating on satisfaction in the selection process.
Completion Rate: The rate for finalizing a specific training course.

Data Sources: It is proposed to provide a short survey for candidates once they end the selection process though the Randstad Talent Platform as a condition for aplying again in the future to other selection processes. The completion rate can be obtained from the Randstad Talent Platform's metrics since courses are handeled in that environment.

What If Analysis

Hypothetic Strategic Scenarios

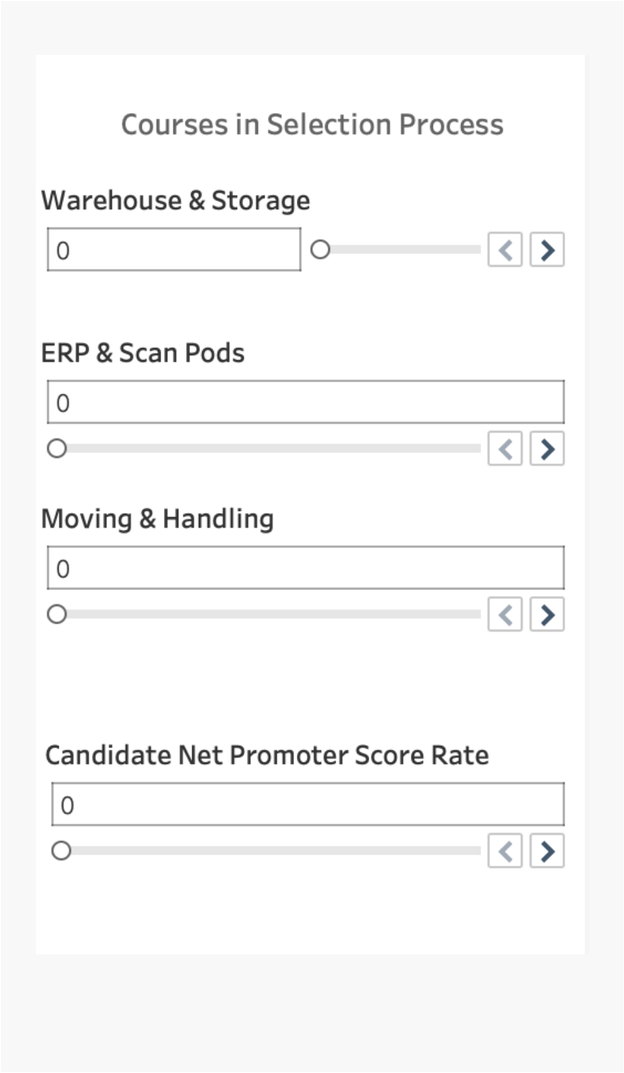

Yield Rate Boost

By operating the "What-If Analysis" parameter built with Tableau's tools, it is possible to see a data-informed, hypothesized view of the company's performance and several HR activity outcomes if the improvement in a specific phase of the selection process were to change.

For instance, a talent acquisition action could be improved to address a particular challenging project for a client in a specific city, and a recruitment fair could be proposed. Before investing time, capital, and people in the organization of that specific action, it could be hypothesized — using previous data — what would happen if the registered candidate phase were to increase by 30%, for example. If the resulting numbers are appealing to what is being intended, that is one more element for data-informed decision-making.

The staretgic value of this tool lies in testing hypotheses and making educated guesses about what would happen if a specific phase of the selection process were to drop or to boost. Furthermore, it can be used for setting up objetives and testing the propossed courses of action.

Courses in Selection Process Boost or Drop

By operating the "What-If Analysis" parameter built with Tableau's tools, it is possible to see a data-informed, hypothesized view of the company's performance and several HR activity outcomes if a specific course offer to candidates is boosted or experiences a drop in its registration rate.

The strategic value of this tool lies in analyzing the hypothesized scenarios in concordance to client's needs to see how is the company's investment on its candidates is paying off in diverse performance aspects.

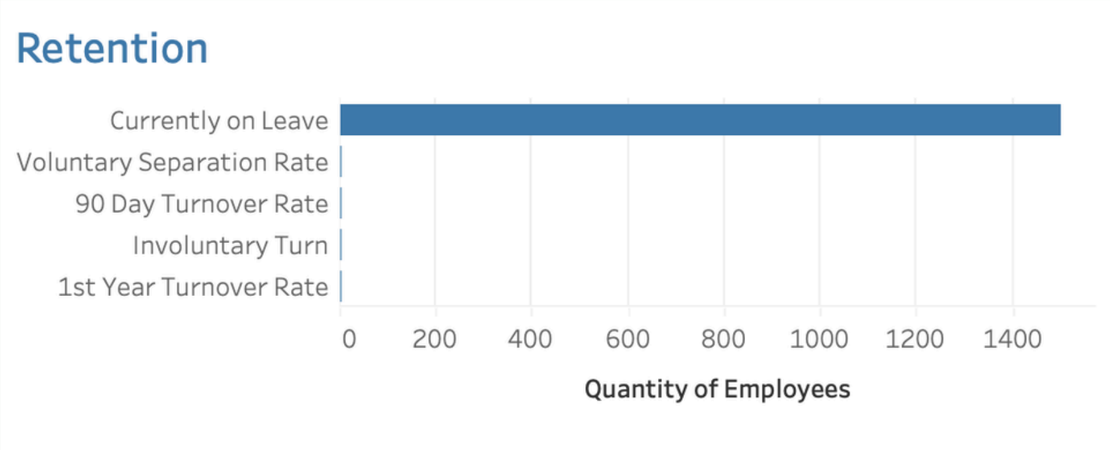

Candidate Net Promoter Score

By operating the "What-If Analysis" parameter built with Tableau's tools, it is possible to see a data-informed, hypothesized view of the company's performance and several HR activity outcomes if the candidate's experience were to increase or drop.

The strategic value of this parameter is to asses wether the improvement of the candidate experience for a particular industry or in a specific country could imply a variation on a specific desired outcome in terms of Recruitment and Selection since the main objetive is to incorporate valuable talent to the company's workforce.

Reward & Compensation

Graphs Explanation - Strategic Management Value - Metrics Glosary - What If Analysis Methodology Applied

Retention

On the current graph it is possible to see the retention rate of the company since it is the reflection of how well the reward and compensation strategies are working.

It is possible to see the different reasons on why an employee could not be generating value for the company but was hired and onboarding and selection resources were allocated to that hire. Turnover reasons are addressed but metrics which could indicate a possible turnover are also addressed such as leaves and absenteeism which can predict turnover.

Data Sources: The company's records on its current workfocrce should be sufficient to feed the dashboard's data.

Pay Range

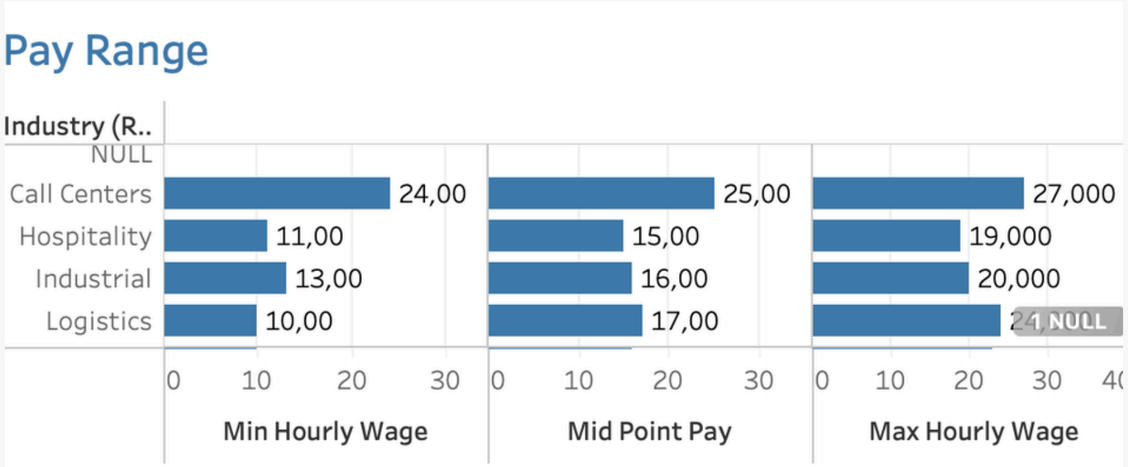

The graph shows the minimum, maximum and mid-pay value for a particular role across the different industries Rndstad Operational works.

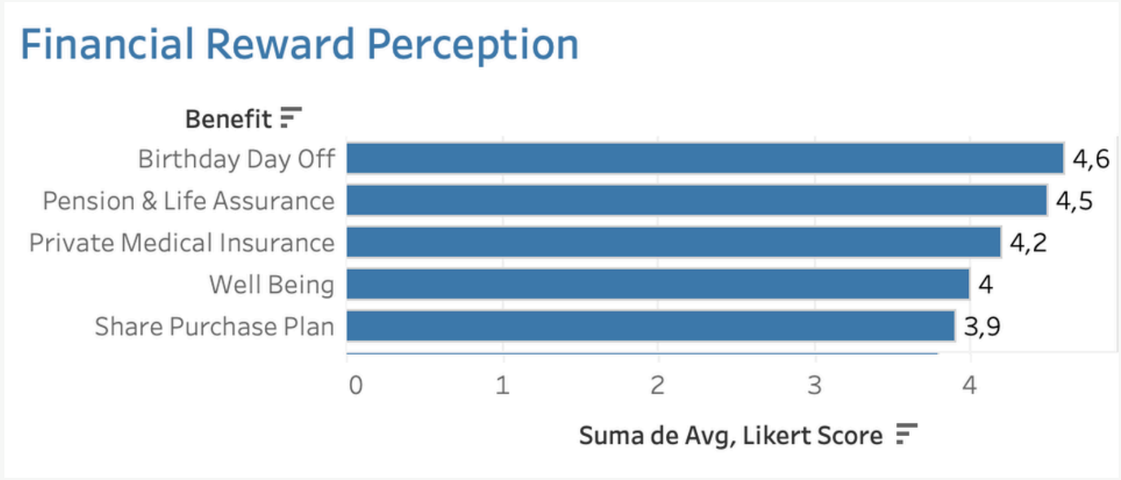

The strategic value for this graph is to quickly identify the suggested and expected hourly pay. Moreover, such tool aids the business development team when sending an invoice for a potential client since Randstad's rates depend on the operational employee + mark up rate (Randstad, 2025).

MetricsGlossary

Pay Range: Minimum, Midpoint, and Maximum pay boundaries for a specific role. It is a key HR compensation metric that helps determine appropriate and competitive employee pay within Randstad's Operational structure.

Data Source: The compensation team.

Financial Reward Perception

On the current graph it is possible to see the perceived value of the employees regarding the offered compensation and financial benefits.

The strategic value of this graph is to understand the reasons on why is the talent remaining at the company, the highest motivations in order to boost them and cut expenses on those benefits which might be costly but not efficient when driving employee engagement.

Data Sources: A monthly short likert scale survey is suggested.

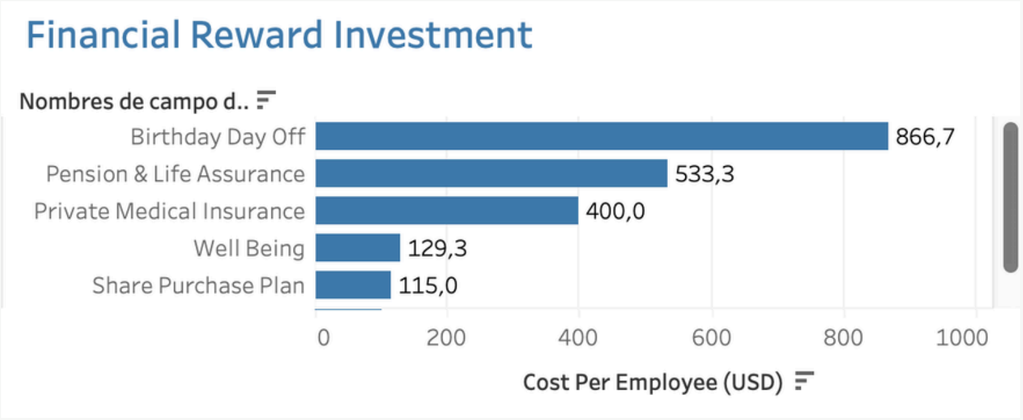

Financial Reward Investment

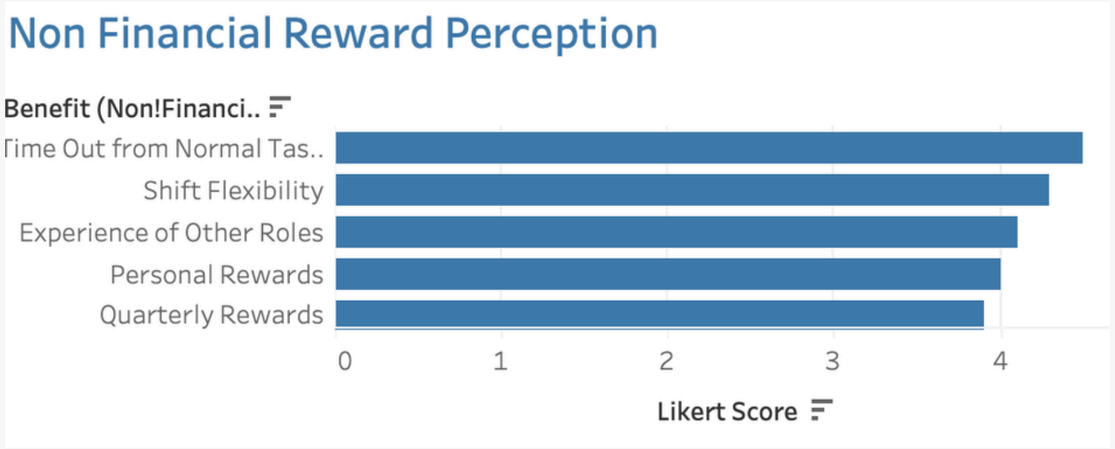

The graph shows the different cost centers in terms of financial rewards.

Leveraging the What-If Analysis, it is possible to see how a higher or lower investment in a specific financial benefit would affect the company's performance, as well as its operational costs and revenues. For an in-depth analysis, it can be filtered by country, industry, and client.

The strategic value of the graph lies in the decision aid when determining in which benefits the company should invest and in which it should reduce costs.

Data Source: The compensation team would provide this information.

Non - Financial Reward Perception

On the current graph it is possible to see the perceived value of the employees regarding the offered compensation and financial benefits.

The strategic value of this graph is to understand the reasons on why is the talent remaining at the company, the highest motivations in order to boost them and cut expenses on those benefits which might be costly but not efficient when driving employee engagement.

Data Sources: A monthly short likert scale survey is suggested.

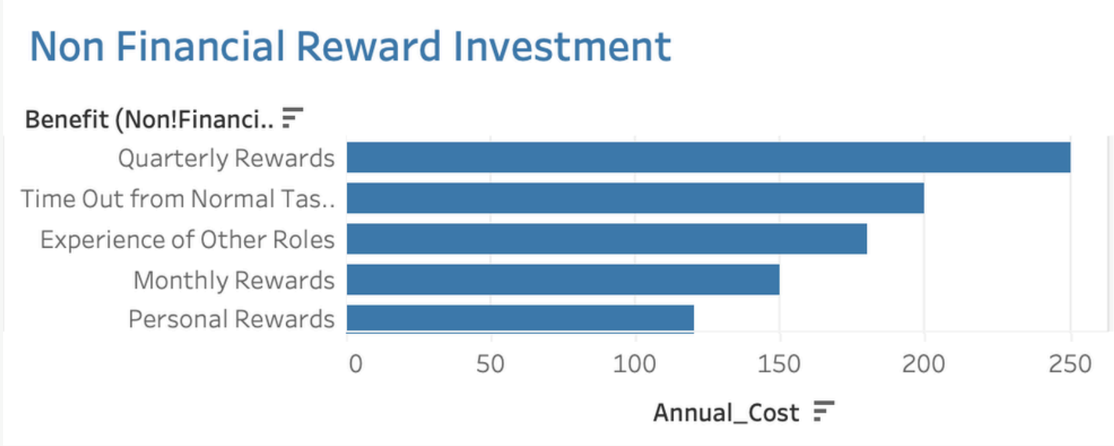

Non - Financial Reward Investment

The graph shows the different cost centers in terms of financial rewards.

Leveraging the What-If Analysis, it is possible to see how a higher or lower investment in a specific financial benefit would affect the company's performance, as well as its operational costs and revenues. For an in-depth analysis, it can be filtered by country, industry, and client.

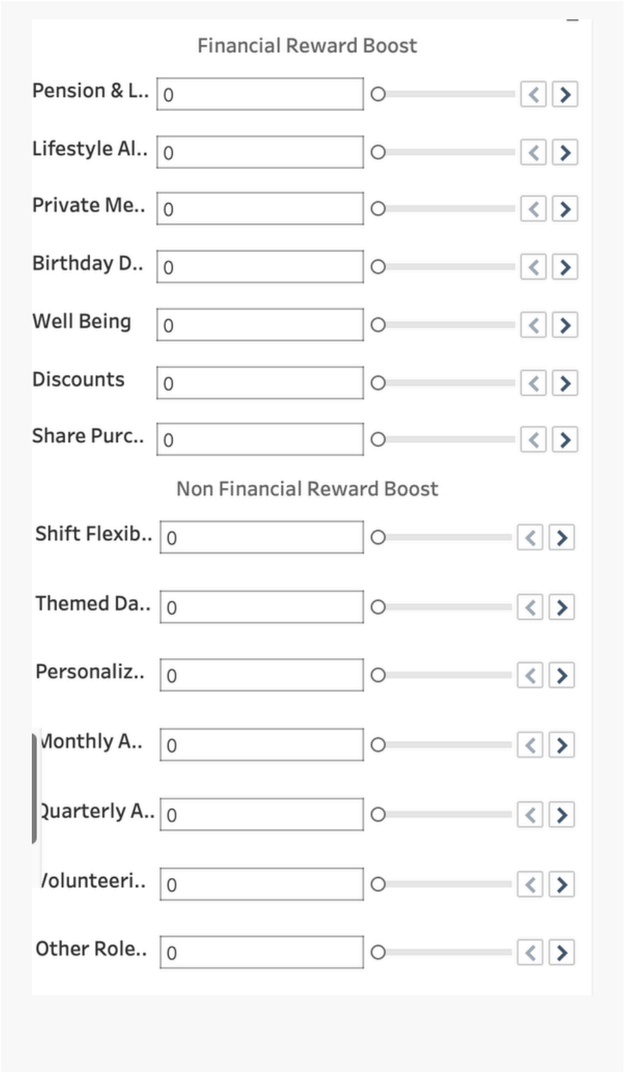

The strategic value of the graph lies in the decssion aid when determining in which benefits the company should invest and in which it should reduce costs.

Data Source: The compensation team would provide this information.

What If Analysis

Hypothetic Strategic Scenarios

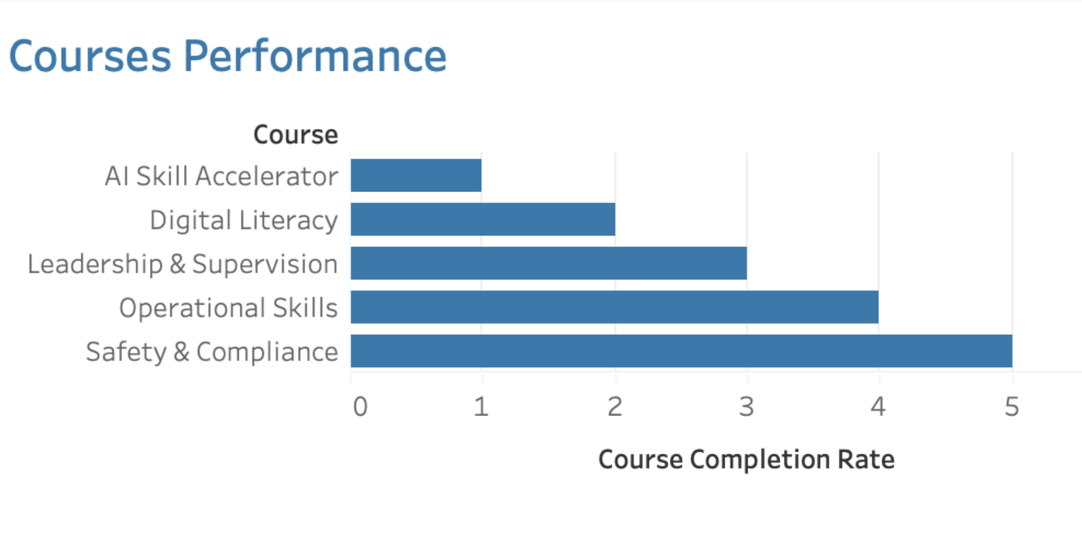

Financial and Non-Financial Reward Investment

By operating the "What-If Analysis" parameter built with Tableau's tools, it is possible to see a data-informed, hypothesized view of the company's performance and several HR activity outcomes if the compensation investment in a specific cost center were increased or decreased.

Strategic resource allocation demands data-informed measurement in order to clearly analyze the possible outcomes of a variation in the current distribution. Moreover, compensation and reward have the power to influence employee morale, experience, and performance. Consequently, being able to analyze the hypothetical scenario of a decision made in reward management aspects is highly valuable.

Training & Development

Graphs Explanation - Strategic Management Value - Metrics Glosary - What If Analysis Methodology Applied

Course Performance

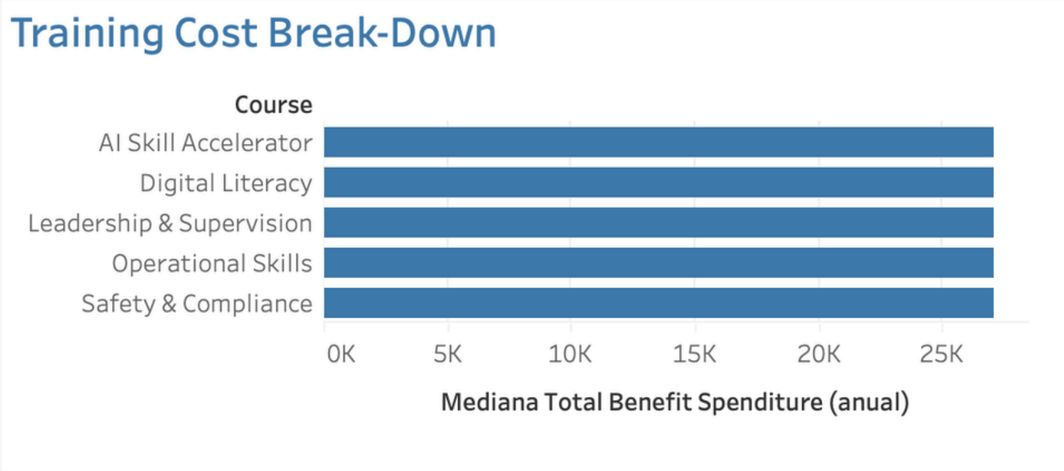

The graph above shows the completion rate for all the training courses proposed for employees. The "AI Skill Accelerator" is paramount for Randstad's operations, as it is part of the desired metrics to accomplish.

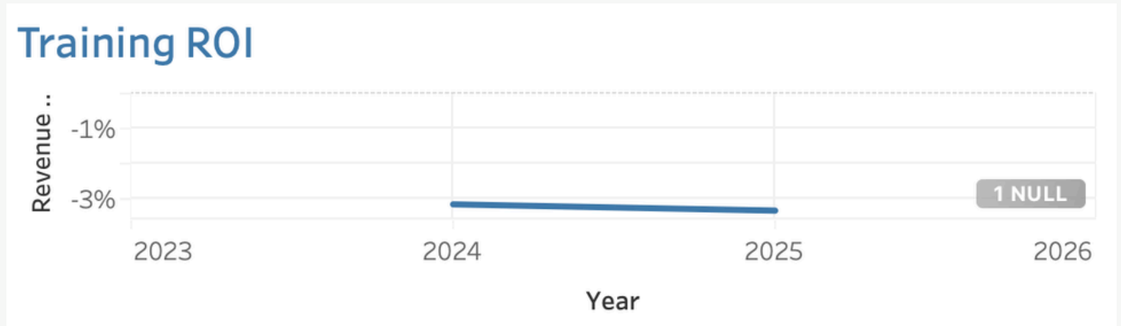

Data Source: Since all training courses are carried out on the digital environment of the Randstad Talent Platform, the metrics from that platform will inform this graph.

Training Cost Breakdown.

The graph shows the cost of each and every training course provided to the employees in order to make strategic decisions regarding the nature and continuity of them.

Data Source: The Learning and Development team will provide the information regarding its budgets and spenditure rate.

Training ROI

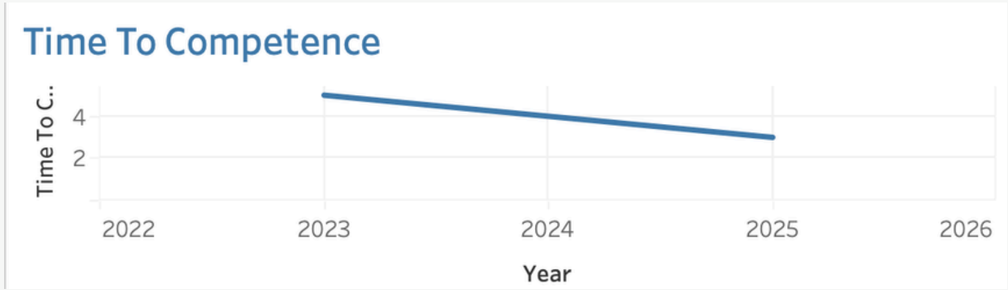

On the current graph it is possible to see the ROI in accordance to the training strategies put in place so as to clearly asses whether those strategies are being advantageous or rather insufficient.

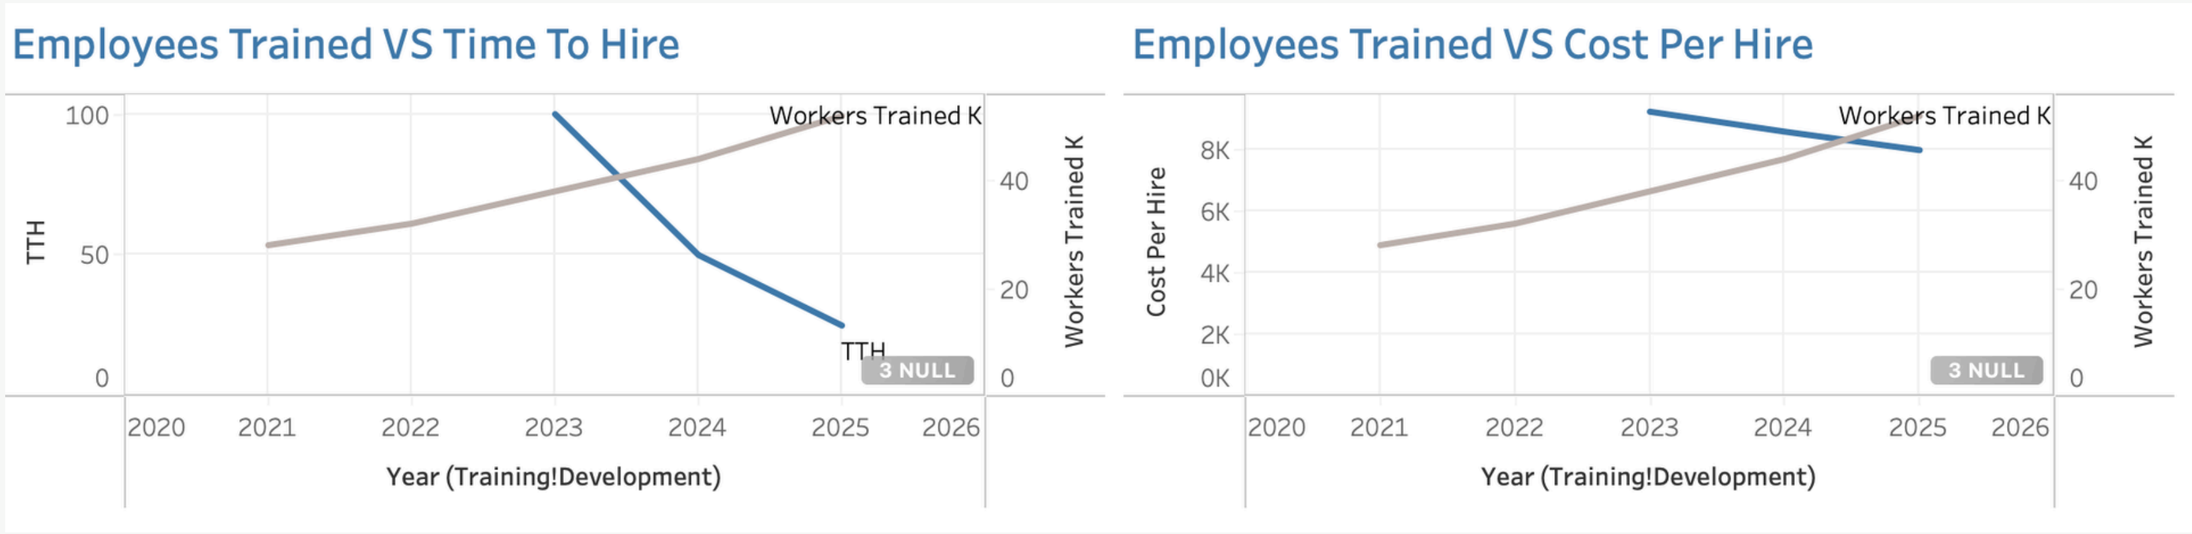

In this case,the training ROI is calculated the “Revenue FTE” variation in relation to the years and quarters since it is understood that the training strategies are expected to see its results on the company’s revenue.

Time to Competence

Time to Competence is also graphed in the Training and Development section, in order to monitor the impact of the training and development strategies undertaken by current employees. Based on the 70-20-10 model, it can be inferred that most learning is gained through interactions with others and within the work environment itself.

The underlying logic is that a better trained workforce would help new hires, during onboarding, learn from a higher quality source. This should positively impact the reduction of Time to Performance and Time to Proficiency improving the quality of the service offered,inclining clients to choose Randstad and Operational and renew their contracts.

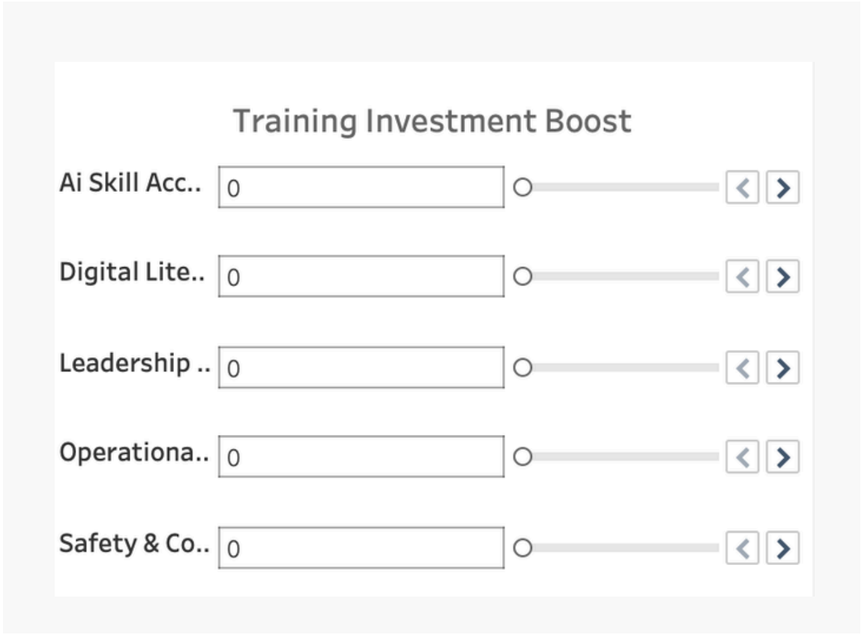

Employees Trained VS Time to Hire (TTH) and Cost Per Hire (CPH), respecitvely.

The graph shows the correlation between the quantity of employees trained and the TTH and CPH, respectively. The underlying logic states that if a larger number of current employees are trained in the skills demanded by the industry and clients, new project positions could be filled with existing talent already within Randstad's workforce, significantly reducing vacancies and positively impacting the reduction of cost and time to hire. While this may be the desired outcome, the monitoring of this journey must be carried out daily, since costs and times can shift due to a number of uncontrolled factors.

What If Analysis

Hypothetic Strategic Scenarios

Training Investment Variation

By operating the "What-If Analysis" parameter built with Tableau's tools, it is possible to see a data-informed, hypothesized view of the company's performance and several HR activity outcomes if the investment in certain training courses shifts.

Strategic resource allocation demands data-informed measurement in order to clearly analyze the possible outcomes of a variation in the current distribution and training is no exception.

The startegic value of this tool lies in the decision making aid when determining wether to boost or cut the funds directed to a specific training course.

Metrics Glossary

Randstad and Hr Metrics

EBITA

Earnings Before Interest, Taxes, and Amortization. It shows operating performance excluding non operational costs, useful for comparing efficiency across competitors and years.

Free Chasflow

The cash a company generates after covering operating expenses and capital expenditures. It reflects how much money is available for investment.

EBITDA

Earnings Before Interest, Taxes, Depreciation, and Amortization. A broader profitability measure than EBITA

Weekly Working Employees

The amount of temporary employees Randstad is able to place across
client's project weekly. A key metric used for understading growth.

Yield rate

The amount of candidates which sucesfully move forward toi the next step.

Time to Hire

The amount of time which takes to fill a vacancy.

Time to Performance

The time it takes for a new hire to reach the expected performance level in their role

Time to Proficiency

The time required for an employee to become fully proficient and independently effective at their job, excelling at it.

Time to Competence

The time for a trained employee to apply the new set of skills to its daily routine job. It reflects the efficiency on the training courses.

Candidate Fraud

The quantity of candidates which cheat on the selection process either on the assesment phase or rather in the interview.

Pay Range

The minimum, midpoint, and maximum pay boundary for a specific role. It is a key HR compensation metric that helps determine appropriate employee pay across the organization.

Compliance Fraud

The candidates which lie about their right to work documentation
or are deciving in terms of certifications.

Reward Perception

How current employees percieve their compensartion and reward portfolios.

Retention

he percentage of employees who remain with the company over a specific period.

Reward Investment

The sopenditure in benefits and compensation.
